

# FLOWER PROGRAM

## EXISTING FLOWERS: Annuals, Perennials & Roses

### **SOIL BUILDING & NUTRIENT PLAN**

1. Fertilize at the beginning of the growing season, when flowers start to bloom, and again later in the season for long blooming flowers, such as roses. Approximately every 60 days for annuals and perennials.
2. Pull any compost or mulch away from root zone areas of the flowers.
3. For annuals, perennials and roses you will want to use **Bouquet™ 4-8-4** and **HuMagic® Granular**. Apply throughout the root zone area of the flowers and mix well into the top several inches of soil.

 **Bouquet™ 4-8-4:**                      *APPLY AT 1 -2 TBSP PER FOOT OF HEIGHT OR WIDTH*

 **HuMagic® Granular:**                      *APPLY AT 1 -2 TBSP PER FOOT OF HEIGHT OR WIDTH*

4. Replace the compost or mulch that was removed prior to fertilizing.
5. **NOTE:** Most "mulches" are not "compost" and therefore not fully composted. They can pull nitrogen out of the soil that is needed for healthy growth.

Additional nitrogen may be needed if using chunkier, less composted mulches. In this case you may want to substitute **Bouquet™ 4-8-4** with **Complete™ 6-4-4** & **Soil Enhancer™ 2-10-0**.

 **Complete™ 6-4-4:**                      *APPLY AT 1 -2 TBSP PER FOOT OF HEIGHT OR WIDTH*

 **Soil Enhancer™ 2-10-0:**                      *APPLY AT ½ -1 TBSP PER FOOT OF HEIGHT OR WIDTH*

 **HuMagic® Granular:**                      *APPLY AT 1 -2 TBSP PER FOOT OF HEIGHT OR WIDTH*

6. During the growing season water regularly with **HuMagic® Liquid**.

 **HuMagic® Liquid:**                      *APPLY AT 2 OZ PER GALLON OF WATER MONTHLY  
OR 1 OZ PER GALLON OF WATER BI-WEEKLY*
